Dear Josh.,

Here are the Hfr.H strains, though I expect you already have both of them. The SSB_1 - prototrophic strain is also Az^s and is the parent strain of Wollman's non-lysogenic HfrH with which they did all their work. As you know, the most obvious difference between my Hfr and Cavalli's is that his does not transfer λ to the zygote as judged by zygotic induction. I have not been able to do any bench work for some time and have not checked on these strains, but I anticipate that they will be O.K.

Best wishes,

Bills
